Value Creation and Opportunity Management in Africa's Leather Sector

Rowman & Littlefield The scope of the study reported in this book entails understanding the constraints and providing potential diagnostics to Africa's leather sector, which is otherwise globally, one of the most lucrative agro-based industries in the world, estimated at over US\$ 130Billion. One of the principle core thematic aspects of the leather sector is, characteristically, its long value chain with multiple socio-economic dimensions. These entail employability, creation of wealth, gender parity and rural development. Thusly, in an effort to stimulate scholarly discussion, the study argues that preemptively, the problems facing the leather value chain stratum are high losses, low value addition initiatives and unexplored opportunities that are synonymous with the Africa's leather industry. Indeed, the results of the research conceptualized opportunity management as a critical panacea towards value addition strategy for the leather sector in developing countries. In dealing with this concept, the book evaluated the various value chains phases and identified nine specific issues and variables drawn between value addition and the main leather strata. With this background, the study posed a main question and four sub questions to closely expound on related hypotheses and in lieu pursue four thematic aspects: trade, productivity, competitiveness, and innovation covered in twelve chapters of the book. Conclusively, the book manages to successfully conceptualize as a novelty that opportunity management is integral towards developing a leather value addition strategy for the developing countries with particular emphasis to Africa.

Computational Modelling of Multi-scale Solute Dispersion in Porous Media

An Approach Based on Stochastic Calculus

BoD - Books on Demand This research monograph presents a mathematical approach based on stochastic calculus which tackles the "cutting edge" in porous media science and engineering - prediction of dispersivity from covariance of hydraulic conductivity (velocity). The problem is of extreme importance for tracer analysis, for enhanced recovery by injection of miscible gases, etc. This book explains a generalised mathematical model and effective numerical methods that may highly impact the stochastic porous media hydrodynamics. The book starts with a general overview of the problem of scale dependence of the dispersion coefficient in porous media. Then a review of pertinent topics of stochastic calculus that would be useful in the modeling in the subsequent chapters is succinctly presented. The development of a generalised stochastic solute transport model for any given velocity covariance without resorting to Fickian assumptions from laboratory scale to field scale is discussed in detail. The mathematical approaches presented here may be useful for many other problems related to chemical dispersion in porous media.
